## ENGINE OIL SPECIFICATION

Low quality or obsolete oils do not provide the protection required by modern, high performance engines.

Failure to use an oil that meets the required specification could cause excessive engine wear, a build up of sludge and deposits and increased pollution. It could also lead to engine failure.

Your vehicle's warranty may be invalidated if damage is caused by the use of unapproved engine oil.

Do not use oil additives of any type as engine damage could occur. Use only specified lubricants.

| Model | Specification |
|---|---|
| V8 Petrol engines | SAE 5W-20 meeting Jaguar specification WSS M2C925-A only. |

Jaguar recommends:

**Castrol EDGE Professional**

## TOPPING UP THE OIL

Overfilling with oil could result in severe engine damage.

1. Unscrew the oil filler cap, see **145, ENGINE COMPARTMENT OVERVIEW**.
2. Add oil as indicated by the message centre display.
3. Wait five minutes for the oil level to stabilise then re-check.

It is essential to use the correct specification oil, and to ensure it is suitable for the climatic conditions in which the vehicle is to be operated.

## ENGINE OIL CONSUMPTION

A certain amount of oil consumption is normal. The rate of consumption will depend on the following:

- The quality and viscosity of the oil.
- Climatic conditions.
- The speed at which the engine is being operated.
- Road conditions.

Drivers should expect above normal consumption when the engine is new, and after running-in if high speeds are sustained.
